

IDentoMetric Solutions releases new Lifelong Personal Health Record™ product

IDentoMetric Solutions LLC, Chatham, New Jersey, March 7, 2010

IDentoMetric Solutions (IDMS), a leading supplier of personal life management software, announces the release of Lifelong Personal Health Record (PHR) allowing individuals to take responsibility for their own health records.

The Lifelong PHR software allows users to record their personal health information (health care providers, history of care, current and prior medications, allergies and conditions and more) in an easy to understand format. Reports can be generated for sharing this information with health care providers, emergency personnel or others as needed.

Personal healthcare records are currently stored in many places including doctor's offices, hospitals, clinics, drug stores, medical testing facilities, and many other organizations where one seeks medical attention. Patient information is stored electronically in some doctor's offices, but 92% of all records are stored on paper. Patient information stored at the multiple hospitals visited over a lifetime is stored in different formats and usually is not consolidated for medical or personal use. Information about prescriptions is stored on paper at many pharmacies and electronically by major chains only in the last 10 years. The major chains do not share prescription information. It is left up to the patients to keep and share their information. Medical tests are provided by many different companies and getting the results organized into one consolidated portfolio is nearly impossible. Insurance companies save administrative, diagnostic and treatment information. If a patient changes insurance companies or does not have insurance records, this information is typically stored in a "paid bills" file located somewhere in their house or apartment. If asked by a doctor for their complete medical history, most individuals would not have sufficient health records to accurately respond to their request.

"The Health care industry is in a state of change, and there is no certainty that our current health care providers will be here in the future" said Bob James, one of the founders of IDMS. "A large volume, if not all, of our personal medical history is still contained in paper files held by our doctors or by our other providers. They can be lost in disasters or may not be retained indefinitely. Lifelong PHR allows the user to take control and responsibility for their health records."

IDMS helps individuals to take responsibility for consolidating healthcare information; this healthcare information is currently distributed among many different health care providers with none of them responsible for maintaining all of the information important to a patient. Our intent is to help individuals to prepare personal health records with a goal of leveraging and sharing personal data with health care providers when and where appropriate. Although there are several online repositories for storing personal data, there is no assurance that the data is totally secure, what other uses the sponsor may use the data for, or the availability of the data in the future. With Lifelong PHR, the user controls the access, sharing and backup of their data.

Lifelong PHR is available to individuals for their family's personal use. This software can be an ideal gift for friends, customers and anyone else who understands that no medical provider is responsible for keeping and maintaining their comprehensive personal healthcare record.
